

ABSTRACT

There is provided a novel medical kit which over-comes the problem with non-specific binding and interac-
5 tion, thus providing a highly reliable method for qualitative or quantitative determination of a drug in a biological fluid. Said medical kit comprises a first part coated with a drug conjugate, and a second part which contains a labelled anti-drug antibody, said labelled
10 anti-drug antibody is labelled with gold material and/or latex particles, and is adapted for receiving said biological fluid.
